Hello Java!

- Introduction to Java and JVM
- Writing Java programs
- Java program constructs
- Java stack, heap, and references
- Java class library

OOP Basics

- Introduction to OOP
- Java OOP by practice

Java Core Powers

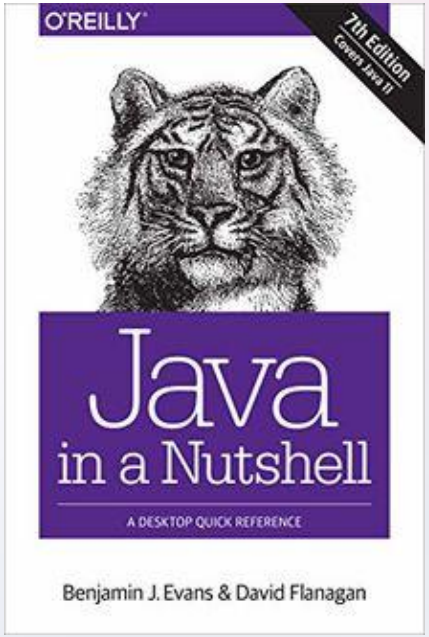
- Exceptions
- JUnit
- Enums
- Generics
- Java collections
- Streams
- Java I/O

Design Patterns

- Creational
- Behavioral
- Structural
- Practice with Java Core & Patterns

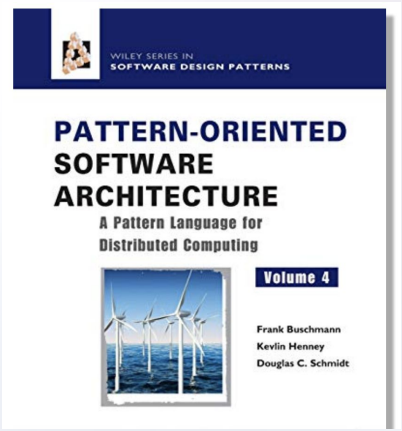
Materials: Java

- Slides
- Exercises
- Homework
- Additional Reading: Java in a Nutshell (7th ed.)



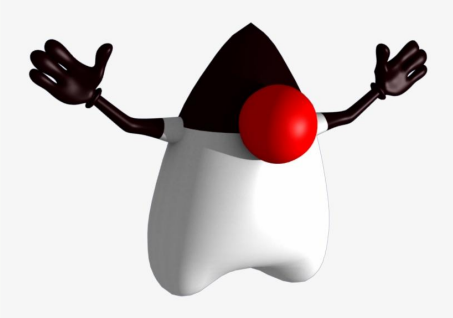
Materials: Design Patterns

- Refactoring Guru: Design Patterns
- Head First Design Patterns
- Design Patterns (Gang of four)
- Pattern-oriented Software Architecture vol. IV



sourcemind

Session 1: Hello Java!



sourcemind

The Java world

- The Java language
- The Java Virtual Machine (JVM)
- The Java ecosystem

1. The Java language

- 1996: Java 1.0 *Introduced JVM and Java language*
  Syntax similar to C/C++ on purpose
  Designed with backwards-compatibility in mind
- 1998: Java 1.2 *Collections API*
- 2004: Java 5 *Enums, generics*
- 2014: Java 8 *Lambda expressions, Streams API*
- ...
- 2018: Java 11 (LTS)
- ...
- **2021: Java 17 (LTS)**

JVM Versions

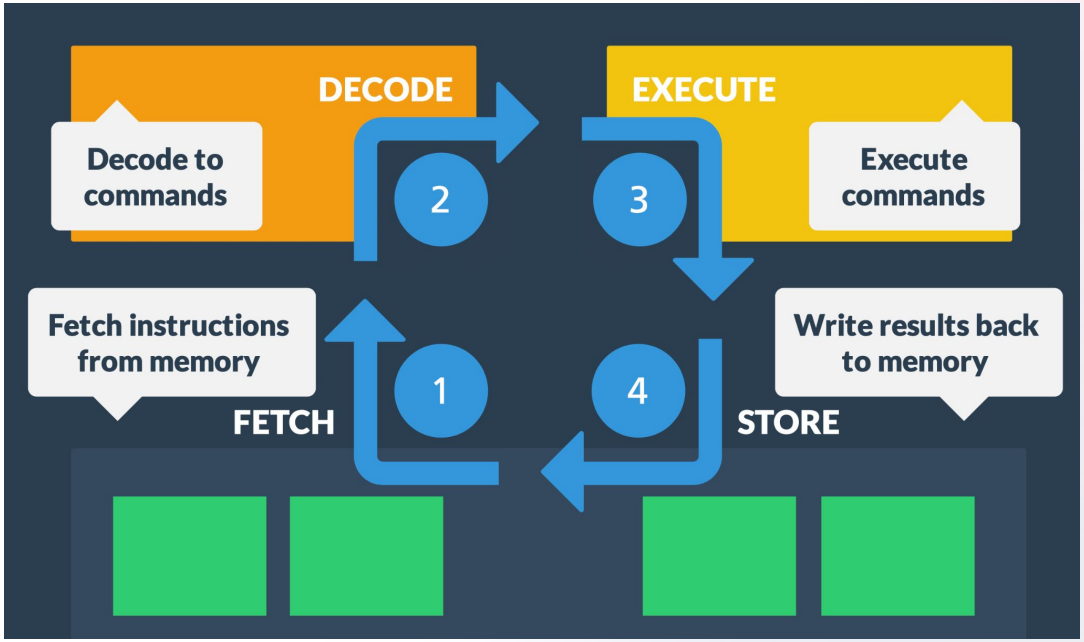
- New version: Every 6 month
- Long-Term Support (LTS) every 3 years
- Go to:

https://openjdk.org/projects/jdk/17/

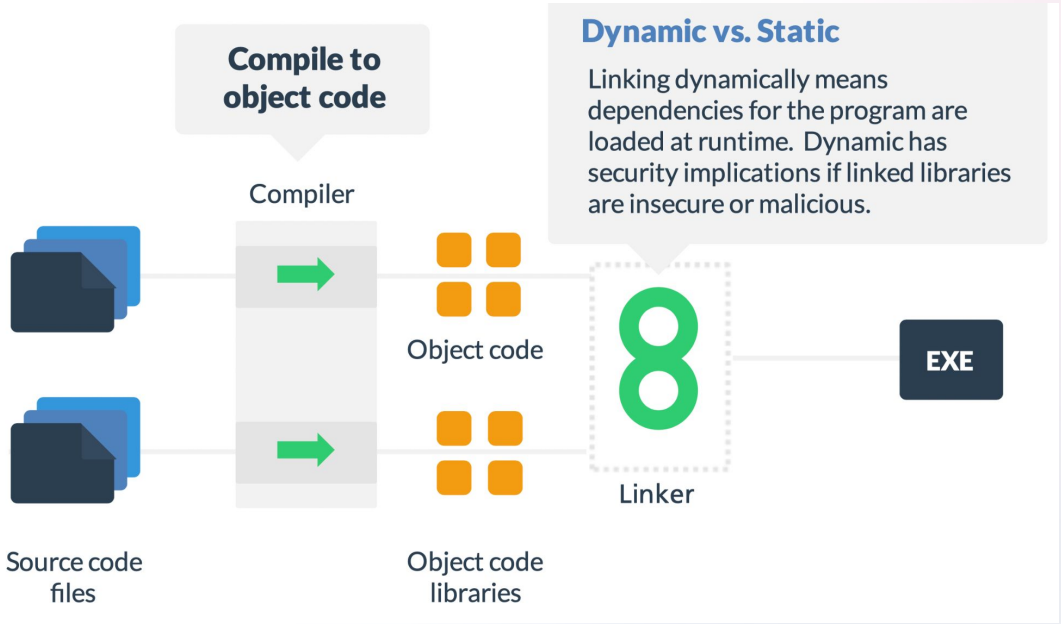
Status: What phase is the JDK version in?
Features: What to expect from that version? (e.g. JDK 11 ZGC exp. → JDK 15 final)
Schedule: Phase 1, 2, ..., GA

How programs execute?

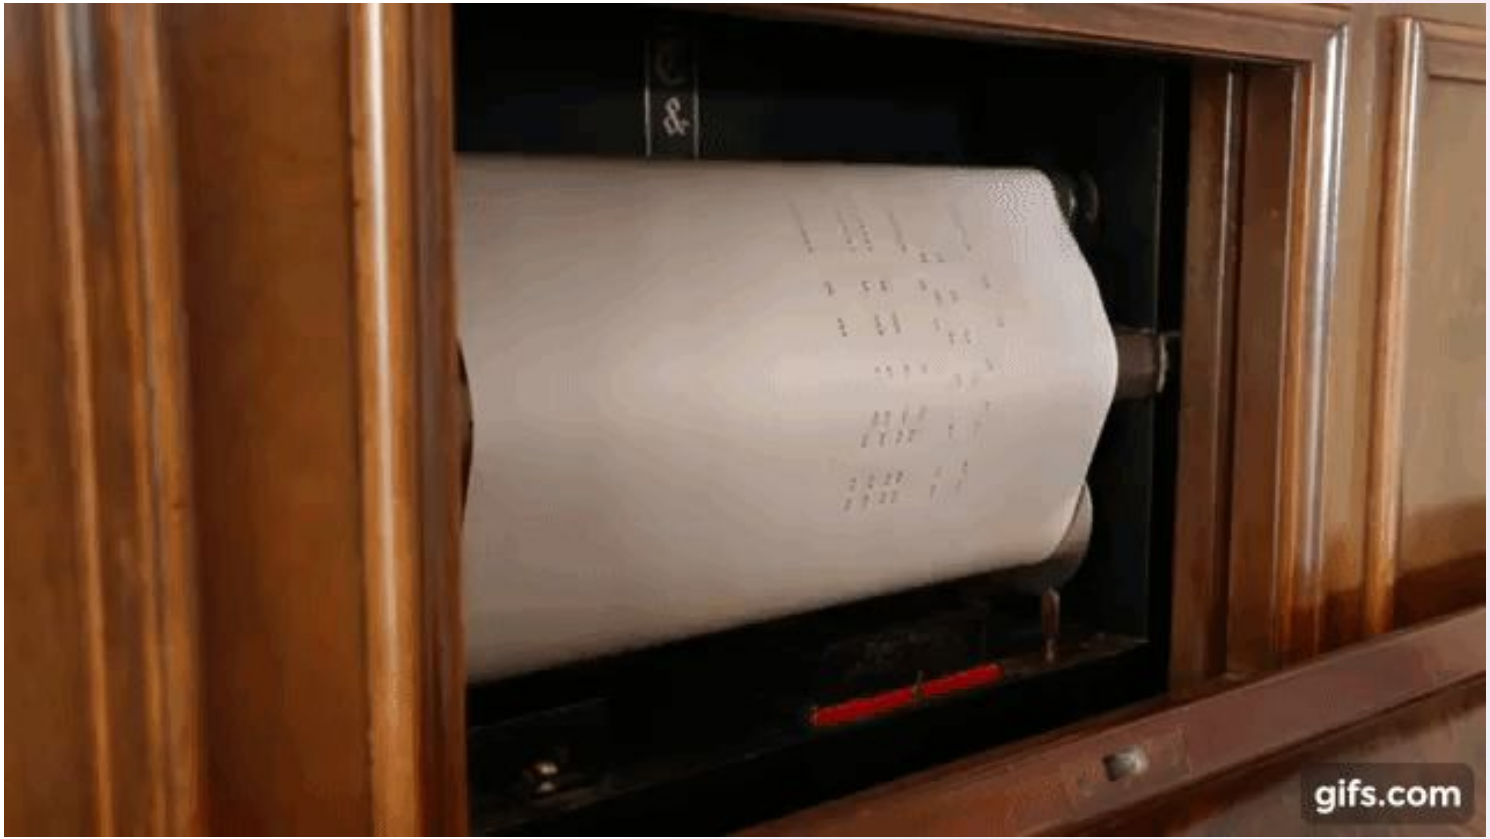
The machine cycle



From source code to machine code



Java’s approach is slightly different

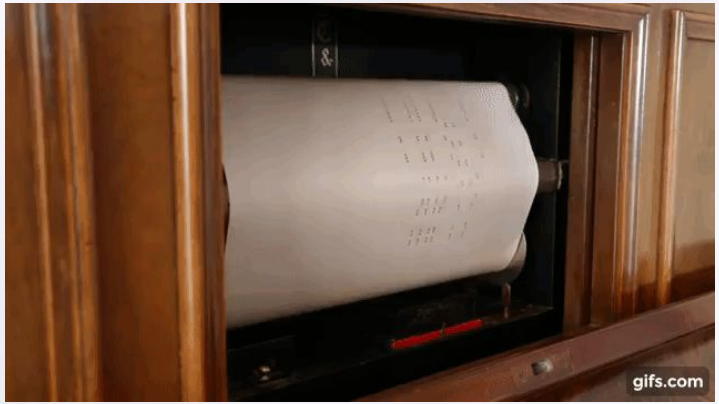


gifs.com

```java
public class Sourcemind {
    public static void main(String args[]) {
        System.out.println("Welcome to Java world!");
    }
}
```

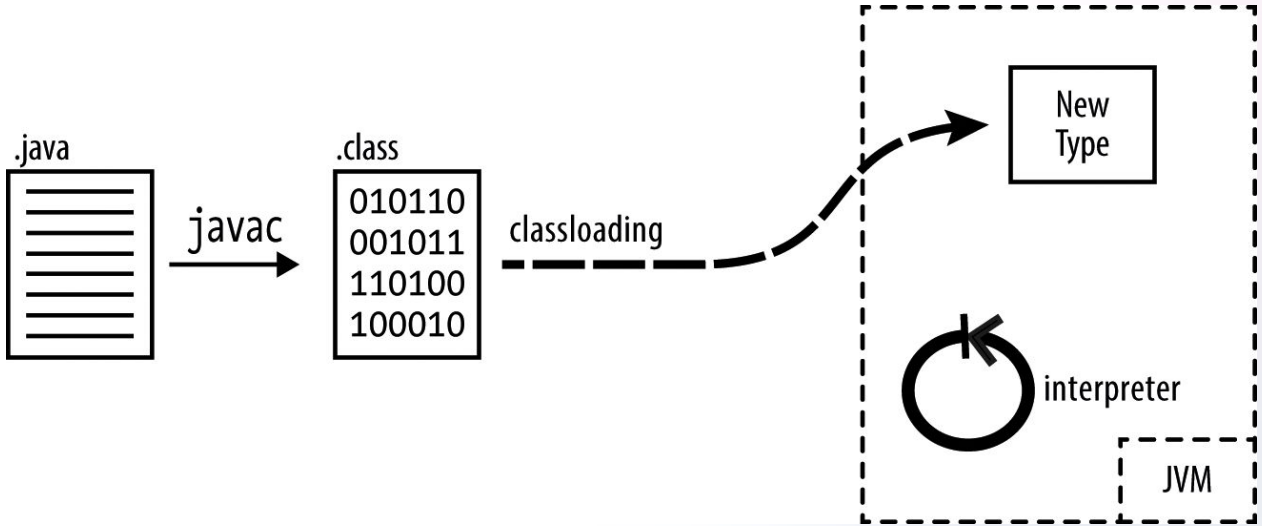
2. Java Virtual Machine (JVM)

- JVM is a program that runs your Java program
- Your Java program is OS-independent
- JVM implementation is OS-dependant
- Java source files are converted to ***bytecodes***
- Bytecodes are instructions that JVM understands
- JVM executes bytecodes
- The OS executes JVM as an isolated process



sourcemind

JVM executes Java programs



Sourcemind.java

```java
public class Sourcemind {
    public static void main(String args[]) {
        System.out.println("Welcome to Java world!");
    }
}
```

```
% javac Sourcemind.java
% ls
Sourcemind.class     Sourcemind.java
```

Sourcemind.class

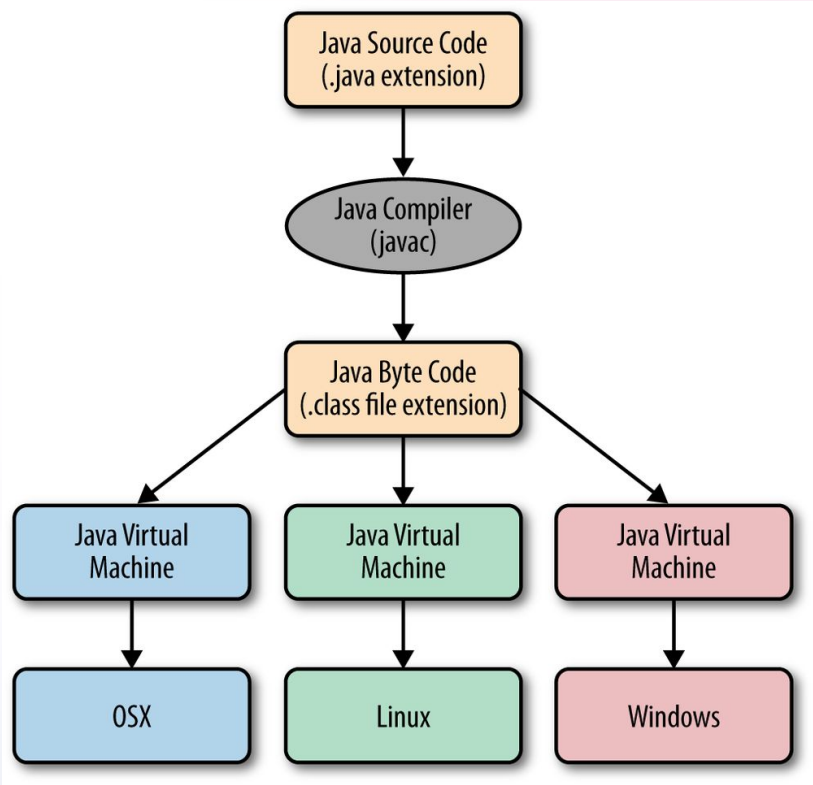
```
?????7

<init>()VCodeLineNumberTablemain([Ljava/lang/String;)V
SourceFileSourcemind.java

                        Welcome to Java world!

ourcemindjava/lang/Objectjava/lang/SystemoutLjava/io/PrintStream;java/io/PrintStream
println(Ljava/lang/String;)V!       *??

        %       ???
```



sourcemind

How JVM sees our code? Bytecodes!

[Class File Format]

[Instruction Set]

sourcemind

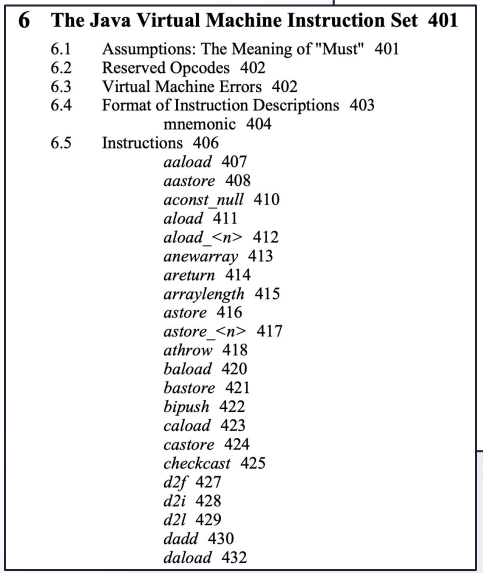
Why?

JVM Design Goals

- Comprise a container for application code to run inside
- Provide a secure and reliable execution environment as compared to C/C++
- Take memory management out of the hands of developers
- Provide a cross-platform execution environment (write once, run anywhere)

JVM is a *specification*

Implement



6 The Java Virtual Machine Instruction Set 401

The Java® Virtual Machine Specification

Java SE 16 Edition

Tim Lindholm
Frank Yellin
Gilad Bracha
Alex Buckley
Daniel Smith

2021-02-12

https://docs.oracle.com/javase/specs/index.html

We will work with OpenJDK 17

Exercise #1

- Download JDK 17
- Install and configure Java on your machine
- Run in command line **`java -version`**

  `echo $JAVA_HOME`
- Write a simple Java program
- Compile and run the program

Exercise #1

- **`javac`**
  Compile source code to bytecodes

- **`java`**
  Execute bytecodes in JVM

- **`jps`, `jmap`**
  Inspect running Java processes

```
% which java
/Library/Java/JavaVirtualMachines/temurin-17.jdk/Contents/Home/bin/java

% cd /Library/Java/JavaVirtualMachines/temurin-17.jdk/Contents/Home/bin

% ls -l
-rwxr-xr-x  1 root  wheel   54752 Dec  8 20:42 jaotc
-rwxr-xr-x  1 root  wheel   50544 Dec  8 20:42 jar
-rwxr-xr-x  1 root  wheel   50576 Dec  8 20:42 jarsigner
-rwxr-xr-x  1 root  wheel   50608 Dec  8 20:42 java
-rwxr-xr-x  1 root  wheel   50560 Dec  8 20:42 javac
```

Java interactive shell

- `jshell`
- Useful for trying code snippets
- Not for development!

```
% jshell

|  Welcome to JShell -- Version 17.0.1
|  For an introduction type: /help intro

jshell> int a = 1
a ==> 1

jshell> String s = (a + 2) + ""
s ==> "3"

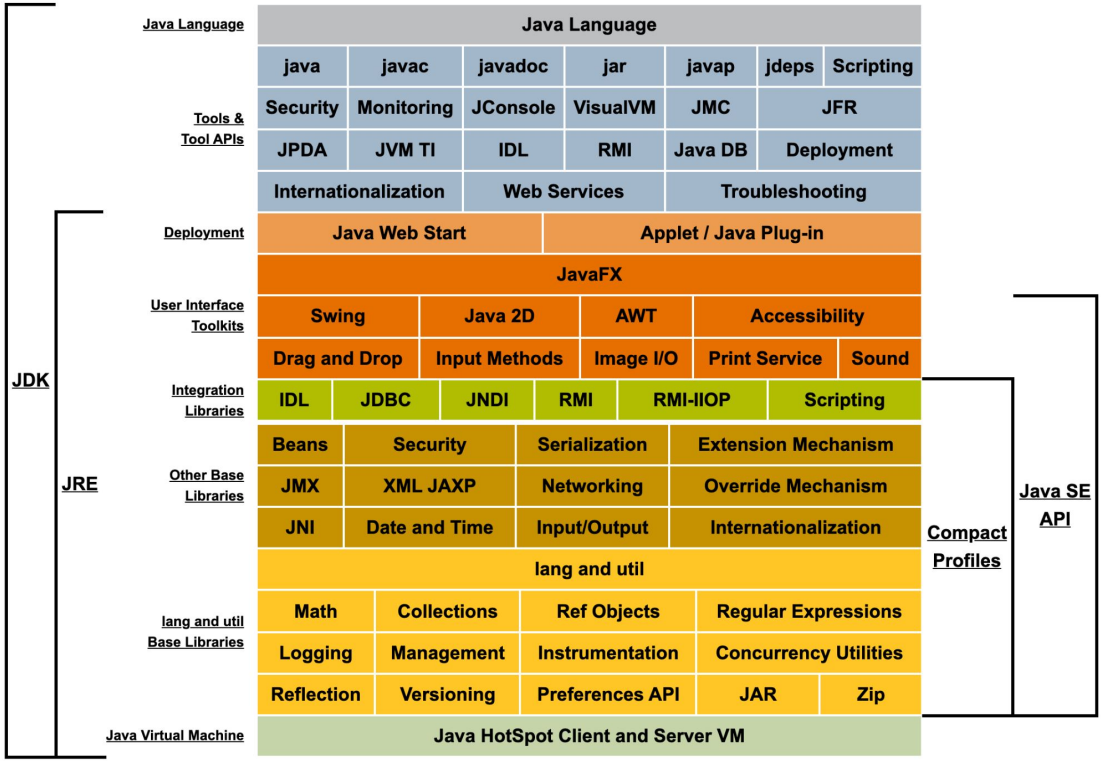
jshell> System.out.println(s)
3

jshell> /exit
|  Goodbye
```

3. The Java ecosystem

- Third-party libraries (reusable and hopefully free components from other developers...)
- Frameworks (e.g. Spring, JSF, JUnit, ...)
- Application servers (e.g. Tomcat, JBoss, Glassfish, ...)
- Build tools (e.g. Maven, Gradle, Ant, ...)
- Datasource connectors (e.g. JDBC)
- Messaging systems (e.g. Kafka)
- ...

Oracle Java Products



To develop Java programs, you need JDK

To execute Java programs, you only need JRE

Source:

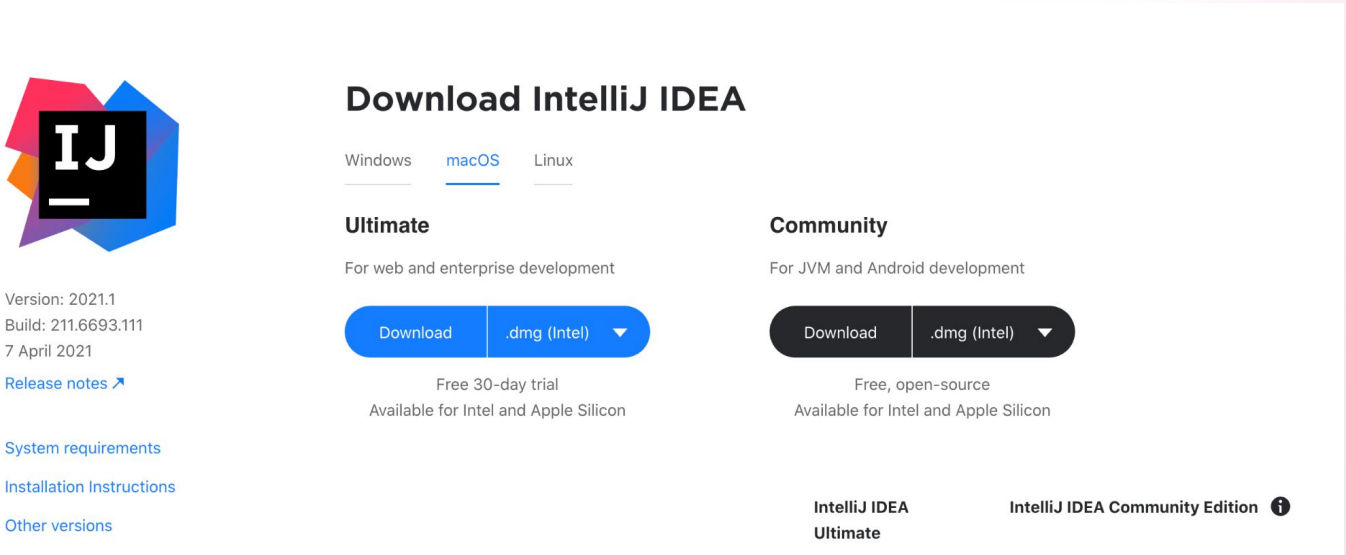
https://docs.oracle.com/javase/8/docs/

sourcemind

Java overview

- Object oriented
- Statically typed
- Multi-threaded
- Portable, platform-independent
- Automatic memory management (GC: garbage collection)
- No pointers or direct access to machine memory
- Mix of interpreted and compiled execution (JIT: Just-in-time compilation)
- Mainly open source
- Widely used, constantly improved
- *Conservative in adopting changes*

Exercise #2: Setting up the IDE



- **IntelliJ IDEA**
- Eclipse
- NetBeans
- BlueJ
- vim
- Sublime
- ...

sourcemind

A Java Program Example

Exercise #3

- Write the provided Java program in your IDE
- Use the command line **javac** tool to compile and **java** to run the program
- Use the IDE to compile and run the program
- Investigate the output

```java
/*
    Our first example
    Receive inputs from OS and print them
*/
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        // Make sure there is at least one argument
        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1); // Report error to OS
        }

       // Print to the OS standard output
        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

```java
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1);
        }

        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

Class declaration

- Every program has a public class
- Filename must match public class name

```java
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1);
        }

        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

Method declaration

- Every program has a ***public static void main*** method
- args = external arguments

```java
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1);
        }

        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

Value assignment

- Declared type (int)
- args.length is also int

```
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1);
        }

        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

```java
public class Example {
    public static void main(String args[]) {
        int len = args.length;

        if (len == 0) {
            System.err.println("No arguments are provided");
            System.exit(1);
        }

        for (int i = 0; i < len; i++) {
            System.out.println("Arg " + i + ": " + args[i]);
        }
    }
}
```

```
% javac Example.java
```

Compile

```
% java Example
No arguments provided

echo $?
1
```

```
% javac Example.java
```

```
% java Example
No arguments provided
```

Execute

```
echo $?
1
```

```
% javac Example.java

% java Example
No arguments provided
```

```
echo $?
1
```

$? gives exit status of last command (1 = error)

```
% javac Example.java

% java Example Hi this is an example
Arg 0: Hi
Arg 1: this
Arg 2: is
Arg 3: an
Arg 4: example

echo $?
0

% java Example "Hi this is an example"
```

Execute and provide arguments

```
% javac Example.java

% java Example Hi this is an example
Arg 0: Hi
Arg 1: this
Arg 2: is
Arg 3: an
Arg 4: example

echo $?
0

% java Example "Hi this is an example"
```

```
% javac Example.java

% java Example Hi this is an example
Arg 0: Hi
Arg 1: this
Arg 2: is
Arg 3: an
Arg 4: example

echo $?
0

% java Example "Hi this is an example"
Arg 0: Hi this is an example
```

Exercise #4

- ExampleAdd is not a **`public class`**.
- **`+`** operator is used for integers and strings.
- `print()` vs. `println()`
- Create another class, `ExampleMult` that multiplies two numbers.
- Can you use a `Program.java` file to write the program? Why?
- Try using `public` for `ExampleAdd` and `ExampleMult` classes.

```java
// Exercise 4: Add two numbers
class ExampleAdd {
    public static void main(String args[]) {
        int a = 3;
        int b = 2;

        // Print initial values
        System.out.print("a: " + a);
        System.out.println(", b: " + b);

        int sum = a + b;

       // Print the addition result
        System.out.println("a + b = " + sum);
    }
}
```

Summary

- The name of the class file (.java) should match the name of the public class.
- Each file can contain only one public class.
- The file may contain multiple non-public classes.
- The name of the non-public classes do not matter, however, it is a good practice to always use the same name as the class for the containing file.
- The class where the program begins must have a

  `public static void main(String[] args) { … }`

  method.
- The `main()` method is invoked by the JVM.
- Input from OS: `String[] args`
- Output to OS: Standard output, Standard error, System.exit(exitCode)

Homework 1

Write the following programs:

1. A program that accepts two integer inputs from user and prints the larger number.
2. A program that accepts a real number and prints its ceiling value. (e.g. 3.2 → 4)
3. A program that accepts arbitrary number of integer values, sorts them, and prints the sorted numbers as the output.

End of session 1
